# Small Group Project Self-Assessment

**Team name**: Flax-6
**URL of the deployed application**: https://hamed54.pythonanywhere.com/
**Team members**:

- Arvin Hadidi-Fard
- Cate Tay Chew
- Hamed Latif
- Katherine Wanting Zhao
- Kausar Khan

**If the team agrees on an effective team size, specify it here. Otherwise, state that the team does not agree.**

The team agrees that the effective team size was five.

## Submission checklist

| Check | Task |
|---|---|
| | The work that is submitted has been produced by members of the team only, without input from other students or third parties. All use of examples from the internet and generative AI are declared in the `README.md` file. |
| | The team is familiar with the required deliverables for this project, outlined in the small group project handbook, available on KEATS. |
| | The team's shared GitHub repository has been registered on Team Feedback. All commits are attributed to a member of the team (check this on Team Feedback!). All collaborative coding sessions have been registered by the committer on Team Feedback. The shared repository has a default branch that corresponds to the accepted version of the software. |
| | The version of the web application that the team wishes to submit has been deployed. The URL is recorded in the `README.md` file. The deployed system is seeded with data that meets the requirements outlined in the specifications. The system is accessible using the required access credentials. The deployed system has been manually tested to ensure all functionality available in development works and is accessible in production. |
| | All team members listed above agree with the claims made in this checklist. |

## Objective

**Briefly outline the business objective of the system you have built. Aim to identify what the system you developed aims to achieve (do not regurgitate the overall assignment). This section should consist of a single paragraph. Aim for less than 100 words.**

This project aims to deliver a functional recipe management platform for students in shared accommodation who struggle with scattered recipe sources and meal planning. Our system integrates three core workflows: users can create and discover recipes with tags, plan weekly meals with a reusable calendar interface, and generate categorised shopping lists automatically from their meal plans. We incorporated AI-powered recipe generation to reduce decision fatigue and added social features, allowing users to follow others and discover popular recipes. The platform combines practical cooking with community features, making consistent home cooking more achievable for students managing budgets and busy schedules.
