Small Group Project Self-Assessment

Team name: Flax-6
URL of the deployed application: https://hamed54.pythonanywhere.com/
Team members:

- Arvin Hadidi-Fard
- Cate Tay Chew
- Hamed Latif
- Katherine Wanting Zhao
- Kausar Khan

If the team agrees on an effective team size, specify it here. Otherwise, state that the team does not agree. The team agrees that the effective team size was five.

Submission checklist

Check	Task
	The work that is submitted has been produced by members of the team only, without input from other students or third parties. All use of examples from the internet and generative AI are declared in the `README.md` file.
	The team is familiar with the required deliverables for this project, outlined in the small group project handbook, available on KEATS.
	The team's shared GitHub repository has been registered on Team Feedback. All commits are attributed to a member of the team (check this on Team Feedback!). All collaborative coding sessions have been registered by the committer on Team Feedback. The shared repository has a default branch that corresponds to the accepted version of the software.
	The version of the web application that the team wishes to submit has been deployed. The URL is recorded in the `README.md` file. The deployed system is seeded with data that meets the requirements outlined in the specifications. The system is accessible using the required access credentials. The deployed system has been manually tested to ensure all functionality available in development works and is accessible in production.
	All team members listed above agree with the claims made in this checklist.

Objective

This project helps students in student accommodation to make everyday cooking easier to fit tailored meals into the busy student lifestyle. It centralises recipes, sorts recipes, and simplifies meal planning. It enables users to discover and store recipes for later, and automatically generate shopping lists, with optional AI support for inspiration. By integrating planning, organisation, and light social features in one platform, the application encourages consistent home cooking and makes managing meals easier and more approachable.

Draft (team planning notes – to be removed)

Target users:

- Students mainly living in shared housing / uni accom
- These students need simple, repeatable meals

Core problem we are solving:

- Recipes are often scattered (notes, screenshots, youtube, social media)
- Cooking decisions takes too much effort
- Meal planning is tedious and often manual
- Shopping lists are forgotten or incomplete

What Recipify helps users to do:

- Discover recipes easily
- Store their own recipes in one place
- Discover recipes from others
- Plan meals for the week
- Reuse previous weeks' meal plans to save time
- Generate shopping lists automatically
- Use AI to get recipe ideas when they don't know what to cook

Business value:

- Helps students cook meals more consistently instead of defaulting to takeaways
- Reduce decision fatigue around cooking
- Makes cooking feel manageable not overwhelming

Social / engagement:

- Follow other users
- See popular and highly rated recipes
- Save favourite recipes
- Build a profile showing personal contributions
- Light community feel; not heavy social media

What makes our app different from other recipe sites:

- Integration of meal planning, shopping lists, and social features in one platform
- AI is used as a decision tool; not just for show

What is not the goal:

- Not intended to be a commercial or professional nutrition planning service
- Not aimed at professional chefs
- No a social platform first
- Not a calorie tracking / fitness app

Use cases

Use cases clarify who uses the system and how they can use it to accomplish particular tasks. Identify the main use cases of your team's application. For each use case, provide:

- Name: a name for the use case. If the name does not describe the task adequately by itself, add a short task description.
- Actor & trigger: Identify who and what starts the interaction with the system.
- Main success scenario & outcome: List the main steps that lead to a successful outcome.
- Alternate flows: Identify possible alternative flow conditions (e.g. what happens under anomalous conditions).

An example of a use case is as follows:

- Name: Place order
- Actor and trigger: Customer selects products and proceeds to checkout.
- Main success scenario: (1) Customer logs in, (2) adds products to cart, (3) proceeds to checkout, (4) enters shipping and payment details, (5) confirms order, (6) system processes payment and displays confirmation. Outcome: new order is placed.
- Alternate flows: Payment fails $\rightarrow$ system redirects to step (4) with error message.

Name (& short task description)	Actor & trigger	Main success scenario & outcome	Alternative flows
